

```
interface Drivable {
```

```
    void drive(); // just declared not implemented.
```

```
}
```

```
abstract class Vehicle {
```

```
    String brand;
```

```
    public Vehicle(String brand) {
```

```
        this.brand = brand;
```

```
    }
```

```
    abstract void fuelType(); // abstract method
```

```
    public void showBrand() {
```

```
        System.out.println("Vehicle Brand: " + brand);
```

```
    }
```

```
}
```

```
class Car extends Vehicle implements Drivable {
```

```
    public Car(String brand) {
```

```
        super(brand); // call constructor of base class.
```

```
    }
```

```
@Override public void drive() {
```

```
    System.out.println("Car is driving");
```

```
}
```

```
@Override void fuelType() {
```

```
    System.out.println("Car uses petrol");
```

• interface has only abstract method.

• But abstract class can have both abstract and concrete method.

```
}  
}  
class Bike extends Vehicle implements Drivable{
```

```
    public Bike (String brand){
```

```
        super (brand);
```

```
    }
```

```
@Override public void drive(){
```

```
    System.out.println(" Bike is riding.");
```

```
}
```

```
}
```

```
public class AbstractionExample{
```

```
    public static void main (String[] args){
```

```
        Car car1 = new Car ("Toyota");
```

```
        car1.showBrand();
```

```
        car1.drive();
```

```
        car1.fuelType();
```

```
        Bike b1 = new Bike ("Yamaha");
```

```
        b1.showBrand();
```

```
        b1.drive();
```

```
// b1.fuel
```

```
}
```

```
}
```
